

RFID Locks

If you're looking for the ultimate in style, ease of management and user functionality, then the RFID Lock is the natural choice.

RFID Locks are the technological alternative to traditional mechanical locks. They are operated by placing a smart card, programmable wristband or Wellness key against the sensor in the lock body. They can be programmed easily using a standalone, hand held programmer, this provides access in case of emergency or where the user has "reserved" a locker. They can also be programmed to open after a specific period of time.

Handheld Programmer

Wellness Key

Powered by 4 AA batteries, each lock will provide over 30,000 cycles before the batteries need changing. The LED display easily identifies the lock as available or

locked and a separate colour indicates low battery level.

The locks have been rigorously tested and are rated as follows

- IP55 for water ingress
- IK7 for external impact
- IK9 for internal impact

RFID Wristbands
